# Autobahn

From Debt to Equity, from Cash through Structured Products, and from Analytics to Execution, Autobahn is Deutsche Bank's family of award winning electronic distribution platforms.

This document will take you through the installation of the Autobahn launcher. This is used to launch members of the Autobahn family that provide installed applications to enable fast execution and a wide range of functionality.

At the time of writing, these applications include:

- Autobahn Fixed Income
- Autobahn Foreign Exchange
- Autobahn Futures & Options
- Autobahn Finance

# Technology Overview

The installed user interface for Autobahn uses technology very similar to Java Web Start. Both Java Web Start and installed UI use the Java Network Launch Protocol (JNLP).

The installer for the new user interface puts a private Java virtual machine onto the users desktop, and a minimal set of components required to contact the web server (a simple JNLP client and tools for proxy detection). It also adds shortcuts to the user's menu.

On first launch, the application downloads and caches the login application from an accessible area of the website. After successful login, the main applications are downloaded and cached from a secure area.

On subsequent login, updates are automatically downloaded; hence there is no upgrade deployment effort after the initial installation.

## Installation

### PC specifications

#### Hardware

Recommended: Pentium 4 2 GHz, 1GB RAM

#### Minimum

Pentium 3, 1 GHz, 512MB RAM

#### Operating System

Windows XP (Windows Vista supported)

#### Minimum Screen Resolution

800 by 600 pixels

#### Connectivity

Internet (if a firewall is used it must allow HTTPS connect tunnels)

Please note that like all applications, the more resource and bandwidth that is utilised by other applications the more adversely this may affect the Autobahn applications.

# Installation Continued

## Install Process

The initial installation must be done by a local administrator. The installed UI for Autobahn is packaged in a standard Windows installer. To install, run the executable advised by your sales person. This is distributed from a URL.

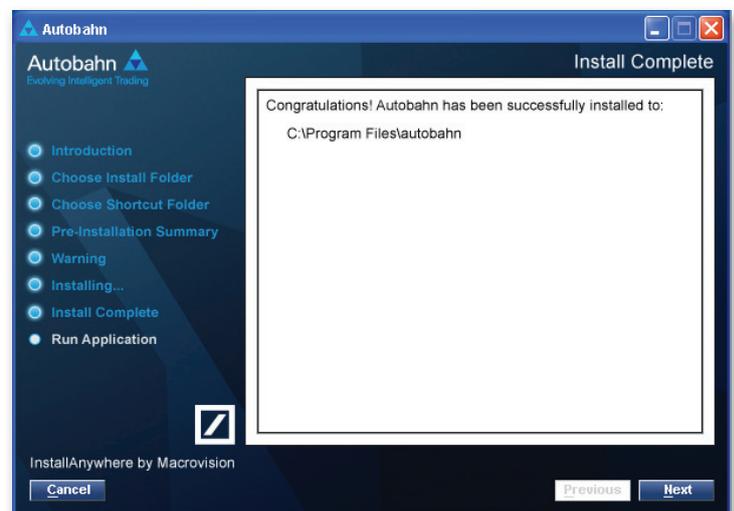

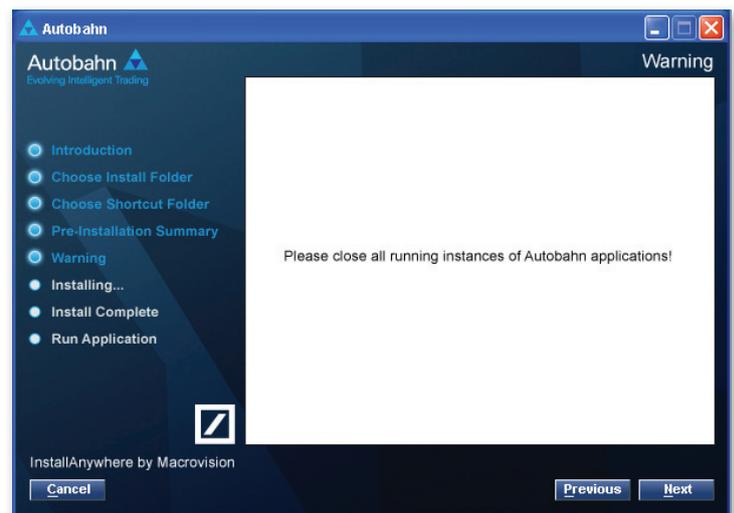

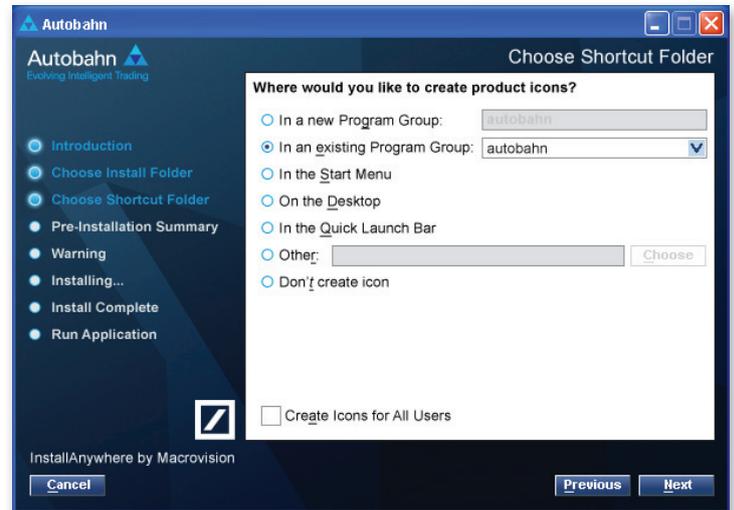

On clicking the executable, the application self extracts and installs.

# Installation Continued

## Install Process Continued

(We recommend in this screen to leave “Create shortcuts for all users” ticked). If you change the name from Autobahn to something else this name will be used in the path used in instructions later on in this document.

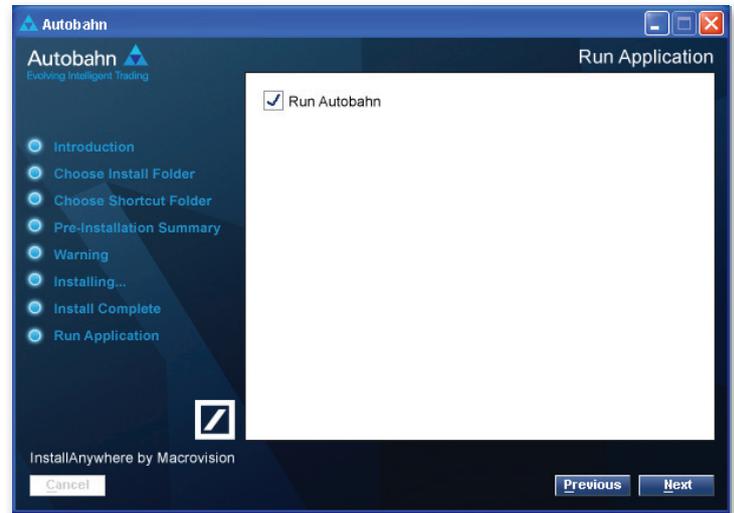

# Installation Continued

## Install Process Continued

After the installation has completed, the administrator should ensure that the new subdirectory structure in the user's profile area is fully modifiable by the user. For example, if the application was installed in: "C:\Program Files\autobahn"

Then the configuration files, logs and caches are located at "%USERPROFILE%\Local Settings\Application Data\autobahn\" and should be modifiable by the user.

# Running

## Application Start

To run the application, click on the "Start" menu "Programs" menu item, then "Autobahn" (or other icon as selected during install) to launch the login box.

To login, use the User Name and password given to you by your Sales representative.

After a successful login, the Autobahn application downloads and launches.

To then launch the individual Autobahn applications, click on the relevant icon.

Checking the tick box next to an individual application will cause it to launch automatically each time you sign in to the Autobahn launcher.

# Running Continued

## Rollback

To uninstall the application completely, use the standard Windows control panel uninstall procedure.

Note this should be done as a user with administrator privileges

## Microsoft Desktop Standards

The application complies with current Microsoft Winlogo desktop standards. This ensures that the application and its users cannot adversely affect the smooth running of other applications.

### In particular

- The application does not write to C:\program files\autobahn at runtime
- The application does not write to C:\Windows at install or runtime
- The application does not write to C:\temp at install or runtime
- The application does not write to C:\ at install or runtime
- The application does not require Internet Explorer security changes
- The application does not depend on other software being present on the machine
- The installed components are not publicly advertised on the machine and will not normally be detected by other applications
- The application does not write to non-user registry keys at runtime
- The application does not require elevated admin rights at runtime

Some corporate policies may recommend that the application make use of a standard public JRE that may be available within the corporation. However the application installs and uses its own private JRE. This ensures each installation is standard which is necessary for support of the application. This private JRE is not advertised publicly on the machine – it exists only within the installation directory of the application.

# Client Connectivity Setup

## Client HTTP proxy configuration

The initial installer contains a minimal set of components – a private Java version, code to download the main application and a URL to the website that will provide the main application and subsequent updates.

Initially, the application will attempt to access its web server URL directly. If this fails, it will attempt to automatically detect proxy settings and use them. If this also fails, a configuration dialogue is prompted.

This dialogue allows proxy settings to be set either manually, or by running the auto detection routine. Current settings are persisted automatically in the users part of the registry (specifically `HKEY_CURRENT_USER\Software\JavaSoft\Prefs\com\db\abprof\bootstrapper\config\autobahn`).

# Client Connectivity Setup Continued

## Radianz Connection (preliminary)

For accessing Autobahn Launcher and Autobahn Fixed Income over Radianz two configuration steps should be performed:

1. Following Radianz IP should be configured on client firewall.
2. Following mapping of physical IP addresses to hostnames must be configured in the host's file on the customer PC or in the internal DNS.
